

*Expressions: String Function -  
Format Number*

2018 Q3

Summary

*An optional parameter to the FormatNumber() expression has been added to allow for thousand separators*

**FormatNumber** string function formats a number to the given precision and now includes an optional **[use separator]** parameter to denote whether to display thousand separators.

To demonstrate this, the following expression divides the Customer Level Revenue by 100 and returns the result with no decimal places, but with thousand separators included as a result of using the optional parameter with the valid value of "T".

`FormatNumber([Customer Level Revenue]/100,0,"T")`

This will produce the following output:

New Expression	Customer Level Revenue
28	2790.00
165	16484.00
258	25828.00
36	3600.00
118	11760.00
145	14545.00
975	97474.00
22	2192.00
1	110.00
1	102.00
0	48.00
1	102.00
